COURSE ROADMAP

1. **Networking Basics & Linux Fundamentals** — Phase 1
   How the internet works, DNS, OSI/TCP-IP, EC2 setup, SSH, filesystem
2. **Advanced Linux & Git** — Phase 2
   Permissions, ACL, shell scripting, Git workflows, GitHub collaboration
3. **Build Tools & Docker** — Phase 3
   Maven, Gradle, npm, pip, Docker architecture, Compose, Amazon ECR
4. **CI/CD & Kubernetes Foundations** — Phase 4
   Jenkins, GitLab CI/CD, kubectl, Pods, Deployments, Services
5. **Advanced Kubernetes & DevSecOps** — Phase 5
   Helm, EKS, HPA/VPA, SonarQube, Trivy, secure CI/CD pipelines
6. **Terraform & Ansible** — Phase 6
   Infrastructure as Code on AWS, configuration management & automation
7. **AWS Services & Observability** — Phase 7
   EC2, VPC, Lambda, RDS, IAM, Prometheus, Grafana, Loki
8. **Capstone Project + Career Preparation** — Phase 8
   End-to-end DevOps project, resume, LinkedIn & mock interviews

How each phase builds on the last

Networking & Linux give you the foundation every server runs on; Git and build tools package your code; Docker containerizes it; CI/CD and Kubernetes ship and orchestrate it; Terraform and Ansible provision and configure the infrastructure underneath; and AWS & observability keep it running in production. By the Capstone, every earlier skill comes together in one project.

PHASE 1 — NETWORKING & LINUX FUNDAMENTALS

Every DevOps engineer needs a rock-solid grip on how machines talk to each other, and how Linux actually works underneath. This phase builds both from zero.

Networking Basics

- ✅ How the Internet works, DNS resolution
- ✅ OSI & TCP/IP models, TCP vs UDP
- ✅ IP addressing, subnetting, ports & protocols

Linux Fundamentals

- ✅ EC2 server setup, SSH & key management
- ✅ Linux kernel, shell & filesystem hierarchy
- ✅ File types, links, I/O redirection, pipes, env vars

Networking · DNS · Linux · EC2

What you'll be able to do after Phase 1

By the end of this phase, every student can set up and SSH into a real EC2 Linux server, and understands exactly how requests travel across a network — the foundation every later phase builds on.

Where this shows up on the job

Every production incident starts with “can we SSH into the box” — this is the phase that teaches you to set up, secure and troubleshoot that server before touching any higher-level tool.

PHASE 2 — ADVANCED LINUX & GIT

From basic commands to real system administration, alongside the version control every engineering team runs on.

Advanced Linux

- ✅ User/group management, permissions & ACL
- ✅ File searching & text processing utilities
- ✅ Package management, archives, job scheduling & LVM

Git

- ✅ Git fundamentals, workflow & branching
- ✅ Merging, conflict resolution & undoing changes
- ✅ Remote repositories & GitHub collaboration

Linux Admin | Shell Scripting | Git | GitHub

What you'll be able to do after Phase 2

By the end of this phase, every student can administer a real Linux server end to end and manage code with the same Git workflows professional engineering teams use daily.

Where this shows up on the job

Every CI/CD pipeline and every production server comes back to these two skills — a DevOps engineer who can't administer Linux or manage Git branches confidently can't do the job.

TRY IT YOURSELF

Write a shell script that archives a folder, then push it to a new GitHub repo using a proper branch and a clean commit message.

PHASE 3 — BUILD TOOLS & DOCKER

From compiling code across every major language ecosystem to packaging an entire application into a container.

Build Tools

- ✅ Maven & Gradle for Java projects
- ✅ npm for Node.js, pip for Python
- ✅ Dockerfile, multi-stage builds & Compose

Docker

- ✅ Docker architecture, images & containers
- ✅ Networking, volumes & Amazon ECR
- ✅ Docker Swarm, YAML basics & debugging

Maven · npm · Docker · Amazon ECR

What you'll be able to do after Phase 3

By the end of this phase, every student has containerized a real multi-service application end to end — from a Dockerfile to a Docker Compose stack pushed to Amazon ECR.

Where this shows up on the job

"It works on my machine" stops being a problem the moment an app is containerized — this is the exact skill every job posting means by "Docker experience".

TRY IT YOURSELF

Write a Dockerfile for any small app you've built, build the image locally, and push it to a free Amazon ECR repository.

PHASE 4 — CI/CD & KUBERNETES FOUNDATIONS

Moving from containers on your laptop to containers that build, test, ship and orchestrate themselves.

CI/CD (Jenkins + GitLab)

- ✅ Jenkins install, architecture & Freestyle jobs
- ✅ Jenkins pipelines, Jenkinsfile & integrations
- ✅ GitLab CI/CD & GitLab Runners

Kubernetes + Helm (Part 1)

- ✅ KIND & kubeadm cluster setup
- ✅ Kubernetes architecture & kubectl
- ✅ Pods, ReplicaSets, Deployments & Services

Jenkins | GitLab CI/CD | Kubernetes | kubectl

What you'll be able to do after Phase 4

By the end of this phase, every student has built a real CI/CD pipeline, then deployed their first application onto a Kubernetes cluster they set up themselves.

Where this shows up on the job

This is the exact workflow behind every "push to deploy" setup — a Jenkins or GitLab pipeline that tests, builds and ships your app onto Kubernetes automatically, every time you commit.

TRY IT YOURSELF

Write a Jenkinsfile that builds a Docker image and deploys it to a local Kubernetes cluster with a single pipeline run.

PHASE 5 — ADVANCED KUBERNETES & DEVSECOPS

Production-grade Kubernetes, plus the security layer every modern CI/CD pipeline is expected to have built in.

Kubernetes + Helm (Part 2)

- ✅ ConfigMaps, Secrets & health probes
- ✅ HPA/VPA, DaemonSets & StatefulSets
- ✅ Persistent Volumes, Ingress, Helm & EKS

DevSecOps

- ✅ DevSecOps fundamentals
- ✅ SonarQube & quality gates
- ✅ Trivy: image & filesystem scanning, building a secure CI/CD pipeline

Helm · EKS · SonarQube · Trivy

What you'll be able to do after Phase 5

By the end of this phase, every student can deploy a production-grade application on AWS EKS with automated security scanning built directly into the pipeline.

Where this shows up on the job

Modern hiring teams expect security scanning inside the pipeline, not bolted on afterward — this phase is what lets you say “DevSecOps” on a resume and back it up in an interview.

PHASE 6 — TERRAFORM & ANSIBLE

The two pillars of modern DevOps: provisioning cloud infrastructure as code, then configuring it automatically.

Terraform

- ✅ Fundamentals, HCL syntax & providers
- ✅ Resources, variables & meta arguments
- ✅ Terraform workflow, state management, remote backend (S3) & workspaces

Ansible

- ✅ Architecture & inventory management
- ✅ Ad-hoc commands & playbooks
- ✅ Variables, facts, handlers, loops, tags, roles & Ansible Vault

Terraform · HCL · Ansible · Ansible Vault

What you'll be able to do after Phase 6

By the end of this phase, every student can provision real AWS infrastructure with a few lines of code, then configure it automatically — the exact skillset behind every “infrastructure as code” job listing.

Where this shows up on the job

Spinning up a server by hand in the AWS console doesn't scale past a handful of machines — Terraform and Ansible are how real teams provision and configure hundreds of servers identically, every time.

TRY IT YOURSELF

Write a Terraform script that provisions a free-tier EC2 instance, then an Ansible playbook that installs and configures a web server on it.

PHASE 7 — AWS SERVICES & OBSERVABILITY

The core AWS services real DevOps job postings ask for, plus the monitoring stack that keeps production systems visible and reliable.

AWS Services

- ✅ Compute: EC2, Auto Scaling, ECS, Fargate, Lambda
- ✅ Networking: VPC, Application Load Balancer
- ✅ Storage/DB: S3, ECR, RDS, CloudWatch, CodePipeline & IAM

Observability

- ✅ Prometheus & PromQL
- ✅ Grafana dashboards & AlertManager
- ✅ Loki, Promtail & LogQL

AWS · EC2 · Prometheus · Grafana

What you'll be able to do after Phase 7

By the end of this phase, every student is fluent across the core AWS services real job postings ask for, with a full observability stack monitoring everything they've built.

Where this shows up on the job

A deployment that isn't monitored is a production incident waiting to happen — Prometheus, Grafana and Loki are the exact stack behind the alerts and dashboards every on-call DevOps engineer relies on.

FINAL STRETCH

CAPSTONE PROJECTS & PLACEMENT PREP

Three real, hands-on DevOps builds, then turning that proof of work into offers.

Live Projects

- ✅ Infrastructure Provisioning with Terraform
- ✅ App Deployment using Ansible
- ✅ Monitoring Stack with Prometheus/Grafana

Career Preparation

- ✅ Resume building & GitHub profile optimisation
- ✅ LinkedIn profile optimisation
- ✅ Mock interviews & DevOps interview prep

A complete end-to-end DevOps project

Every student integrates their capstone work into one project — infrastructure provisioning, CI/CD implementation, containerization, Kubernetes deployment and monitoring integration, all combined — the same stack real DevOps teams run in production.

FORMAT
Team-based, mentor-reviewed builds

OUTCOME
3 portfolio-ready DevOps projects

TOOLS USED ACROSS THE CAPSTONE

Terraform · Ansible · Docker · Kubernetes · Jenkins · Prometheus

WHERE OUR LEARNERS WORK

OUR HIRING NETWORK

Qualibytes alumni have gone on to work at leading IT services and product companies across India.

TCS	Infosys	Wipro	Accenture	Capgemini
Tech Mahindra	Deloitte	Flipkart	Genpact	DXC Technology

Why colleges & students partner with us

Placement outcomes come down to one thing above all: real project experience plus an active hiring network. Our combination of live infrastructure projects and a 100+ hiring network gives students a measurable edge over purely theoretical training.

WHAT OUR PLACEMENT TEAM DOES

- ✅ Matches profiles to live network openings
- ✅ Tracks applications alongside the student
- ✅ Shares direct referrals where a fit exists
- ✅ Preps for each company's interview style

Placement outcomes depend on individual performance and batch. This list reflects organisations where alumni have been placed to date, not a guarantee for any specific company.

INDUSTRIES HIRING OUR GRADUATES

IT & Software · E-commerce · Fintech · Consulting · BFSI · Retail & FMCG

SKILLS & SALARY

- ✅ Provision & manage cloud infrastructure with Terraform
- ✅ Build, deploy & orchestrate containers with Docker & K8s
- ✅ Automate configuration management with Ansible
- ✅ Design CI/CD pipelines with Jenkins & monitor with Grafana

EXPECTED SALARY (INDIA, 2026)

Junior DevOps Engineer (0–1 yr)	DevOps Engineer (1–3 yrs)	Senior DevOps Engineer	DevOps Architect / Lead (Sr.)
₹3.5–6 LPA	₹6–12 LPA	₹12–20 LPA	₹25–40 LPA

Indicative, India market — actual offers vary by candidate, batch performance and hiring company.

Qualibytes' unique advantage

Our sister IT company, Delta 360 Services, gives advanced students real client infrastructure work to practice on — a differentiator no academic institute can match.

CAREER PATHS THIS COURSE OPENS UP

DevOps Engineer · Cloud Engineer · SRE · Platform Engineer

Growth doesn't stop at DevOps Engineer

Most graduates move from Junior DevOps Engineer to Senior DevOps Engineer within 3–5 years, and on to DevOps Architect or Lead roles after that — the same core skills from this course compound with experience.

THE NUMBERS

OUR PLACEMENT TRACK RECORD

Numbers that matter to a career decision — not just marketing.

1000+	8 LPA	40 LPA	100%
STUDENTS PLACED	AVERAGE CTC	HIGHEST CTC	PLACEMENT SUPPORT

Cumulative Qualibytes IT Academy placement figures across all programs to date.

What "100% placement support" means

Every enrolled student receives structured placement assistance — resume building, mock interviews, and active job referrals — through to placement. It reflects the support provided, not a guaranteed job outcome for every individual.

HOW WE TRACK OUTCOMES

Every placement, logged

Our counseling team tracks every student from offer letter to joining date, across every program and batch.

Want the course-wise breakdown?

We're happy to share course-wise placement data during a campus or admissions session.

"Within 4 months of finishing the course, I secured my first role as a Junior DevOps Engineer at a leading fintech company."

Abhinav Singh
BCA Student

"The real-world infrastructure projects helped me build a strong portfolio — recruiters noticed it immediately in interviews."

Priyanka Sharma
B.Tech Student

PRACTICE ON REAL CLOUD & DEVOPS TOOLS

This course is built around the same free-tier tools DevOps teams use in the real world — at no personal cost to you.

AWS Free Tier

New AWS accounts get $100 in credits immediately, with the option to earn up to $100 more within your first 6 months, plus 30+ Always-Free services.

Docker Hub Free Tier

Free public repositories and pulls — enough to build, store and share the container images you create in this course.

Terraform, Ansible & Jenkins

All fully open-source, and GitHub Actions gives every student free CI/CD minutes to run pipelines on every commit.

WHERE YOU'LL USE THIS IN THE COURSE

- ✅ **Phase 4: provisioning real AWS infrastructure**
- ✅ **Phase 5: deploying to a live EKS cluster**
- ✅ **Phase 6: your monitoring stack**
- ✅ **Your 3 live capstone projects**

Good to know

Free-tier limits and terms are set by each provider and can change at any time — always confirm current details before relying on them.

No paid software required

Every tool taught in this course has a genuinely free way to learn and practice on it — so cost is never a barrier to getting hands-on.

IS THIS FOR YOU

WHO SHOULD JOIN

- ✅ Aspiring engineers starting a career in DevOps + AWS
- ✅ Career changers moving into the high-demand DevOps field
- ✅ IT & engineering graduates seeking job-ready skills
- ✅ Business professionals wanting data-driven infrastructure thinking
- ✅ Freelancers & consultants offering DevOps + AWS as a service
- ✅ Upskilling professionals from support, QA or systems operations

QUALIBYTES PLACEMENT ROADMAP

STEP 1
4 months of live industrial training by working professionals

STEP 2
Hands-on work on Delta 360's live major projects

STEP 3
Mock interviews & interview question prep

STEP 4
Resume, Naukri & Indeed profile updates, job references

No prior experience? No problem

The course starts from fundamentals — no prior coding or technical background is required. Students are guided from zero to job-ready through structured, mentor-led phases, with real infrastructure projects layered in as skills build.

Learn at your own pace

Live sessions are recorded and available 24/7, so working professionals and students alike can revisit any topic without falling behind the batch.

Managing Director

- ✅ Industry-recognised credentials
- ✅ Backed by 3 live DevOps projects, not just attendance
- ✅ Makes your resume stand out among recruiters
- ✅ Guided by experienced DevOps & cloud mentors

> *"Excellent content, hands-on labs, and expert instructors. Gained confidence to work in real-world cloud environments."*
>
> **Priyanka Sharma**
> B.Tech Student

> *"Clear explanations, real-world projects, and strong mentorship — a solid stepping stone for a cloud or DevOps role."*
>
> **Sandeep Kumar**
> MBA Student

> *"Comprehensive curriculum, practical labs, and supportive trainers made learning engaging and effective."*
>
> **Abhinav Singh**
> BCA Student

A credential that means something

Your certificate is signed off only after your capstone projects are reviewed by a mentor — so it tells a recruiter you can actually do the work, not just that you sat through the sessions.
